

GeneralAire Water Saver™ Controller FAQs

What is the Water Savor™ controller?

The Water Savor™ controller is a unit that attaches to a flow-through humidifier system found on a home's furnace. The controller conserves the amount of water the system uses while still meeting a home's humidity needs (as recommended by Health Canada).

How does it work?

The Water Savor™ powers on when the humidifier needs water. In a traditional humidifier, water runs continually through the system until the set humidity level is reached. The Water Savor™ controller senses and delivers only the amount of water needed, avoiding excessive water use.

How much water can it save?

Using a Water Savor™ controller can reduce humidifier water use by at least 50%.

The Water Savor™ controller needs to be installed by a professional in order to qualify for the rebate program.
